Lesson 8: Exploring the Symmetry in Graphs of Quadratic Functions

Student Outcomes

- Students examine quadratic equations in two variables represented graphically on a coordinate plane and recognize the symmetry of the graph. They explore key features of graphs of quadratic functions: y-intercept and x-intercepts, the vertex, the axis of symmetry, increasing and decreasing intervals, negative and positive intervals, and end behavior. They sketch graphs of quadratic functions as a symmetric curve with a highest or lowest point corresponding to its vertex and an axis of symmetry passing through the vertex.

Classwork

Opening (4 minutes): Graph Vocabulary

Introduce the following terms and discuss their meaning. You can demonstrate these features on a projection of one of the photographs or on a graph you sketch or project onto the screen. If students keep a journal, have them put these terms in their vocabulary section.

Graph Vocabulary

- **Axis of Symmetry**: Given a quadratic function in standard form, \( f(x) = ax^2 + bx + c \), the vertical line given by the graph of the equation, \( x = -\frac{b}{2a} \), is called the axis of symmetry of the graph of the quadratic function.

- **Vertex**: The point where the graph of a quadratic function and its axis of symmetry intersect is called the vertex.

- **End Behavior of a Graph**: Given a quadratic function in the form \( f(x) = ax^2 + bx + c \) (or \( f(x) = a(x - h)^2 + k \)), the quadratic function is said to open up if \( a > 0 \) and open down if \( a < 0 \).
  - If \( a > 0 \), then \( f \) has a minimum at the x-coordinate of the vertex, i.e., \( f \) is decreasing for x-values less than (or to the left of) the vertex, and \( f \) is increasing for x-values greater than (or to the right of) the vertex.
  - If \( a < 0 \), then \( f \) has a maximum at x-coordinate of the vertex, i.e., \( f \) is increasing for x-values less than (or to the left of) the vertex, and \( f \) is decreasing for x-values greater than (or to the right of) the vertex.
A quadratic function is a polynomial function of degree 2. A quadratic function is in standard form if it is written in the form, \( f(x) = ax^2 + bx + c \), for constants \( a, b, c \) with \( a \neq 0 \) and for \( x \) any real number. Given a quadratic function in standard form, the vertical line given by the graph of the equation, \( x = \frac{-b}{2a} \), is called the axis of symmetry of the graph of the quadratic function.

End behavior: This graph of a quadratic function opens up. As the values of \( x \) approach \( +\infty \) and \( -\infty \), the values of \( y \) approach \( +\infty \).

**Exploratory Challenge 1**
Below are some examples of curves found in architecture around the world. Some of these might be represented by graphs of quadratic functions. What are the key features these curves have in common with a graph of a quadratic function?

St. Louis Arch

Bellos Falls Arch Bridge

Arch of Constantine

Roman Aqueduct

The photographs of architectural features above MIGHT be closely represented by graphs of quadratic functions. Answer the following questions based on the pictures.

a. How would you describe the overall shape of a graph of a quadratic function?
   Student answers will vary. They may use the letter \( U \) or a physical object (e.g., bowl) to describe the shape. Pose a question for students to think about during the lesson and discuss at the end of the lesson. Does the letter \( U \) (or a cup or a bowl) give an accurate description of a quadratic function? Why, or why not? Discuss the symmetric nature of the picture and the line of symmetry on each photograph. (Note: The letter \( U \) and the physical objects are not infinite and usually do not continue to widen as they open up or down.)

b. What is similar or different about the overall shape of the above curves?
   All have either a highest or lowest point and spread out from there. Some are wider or narrower at the base. Some are opening up (the bridge edit) and some down (the arches).

**IMPORTANT**: Many of the photographs in this activity cannot actually be modeled with a quadratic function but rather are curvilinear curves. These are “quadratic-like” and can be used for our exploration purposes as they display many of the same features, including the symmetry we are exploring in this lesson.
Use the graphs of quadratic functions A and B to fill in the table and answer the questions on the following pages.

**Graph A**

<table>
<thead>
<tr>
<th>x</th>
<th>f(x)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-1</td>
<td>8</td>
</tr>
<tr>
<td>0</td>
<td>3</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>2</td>
<td>-1</td>
</tr>
<tr>
<td>3</td>
<td>0</td>
</tr>
<tr>
<td>4</td>
<td>3</td>
</tr>
<tr>
<td>5</td>
<td>8</td>
</tr>
</tbody>
</table>

**Graph B**

<table>
<thead>
<tr>
<th>x</th>
<th>f(x)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-5</td>
<td>-5</td>
</tr>
<tr>
<td>-4</td>
<td>0</td>
</tr>
<tr>
<td>-3</td>

<td>(1, 0)</td>
<td>(3, 0)</td>
</tr>
<tr>
<td>2 Vertex</td>
<td>(2, -1)</td>
<td></td>
</tr>
<tr>
<td>3 Sign of leading coefficient</td>
<td>positive</td>
<td>negative</td>
</tr>
<tr>
<td>4 Vertex represents a minimum or maximum?</td>
<td>minimum</td>
<td>minimum</td>
</tr>
</tbody>
</table>

**5 Points of Symmetry**

- **Graph A:**
  - Find f(-1) and f(5).
  - f(-1) = 0 and f(5) = 0
  - f(x) > 0, since f(3) = 0 and the graph is increasing on both sides of the vertex, all values beyond f(3) will be greater than f(-3).

- **Graph B:**
  - f(-1) = 3 and f(-3) = 3
  - f(-1) = 3 and f(-3) = 3
  - Predict the value for f(-6) and explain your answer.
  - f(-6) = -12, this is the point of symmetry for f(x).

**6 Increasing and Decreasing Intervals**

- **Graph A:**
  - On what intervals of the domain is the function depicted by the graph increasing?
  - (3, +∞)
  - On what intervals of the domain is the function depicted by the graph decreasing?
  - (-∞, 3)

- **Graph B:**
  - On what intervals of the domain is the function depicted by the graph increasing?
  - (-∞, -2)
  - On what intervals of the domain is the function depicted by the graph decreasing?
  - (-2, +∞)

**7 Average Rate of Change on an Interval**

- **Graph A:**
  - What is the average rate of change for the following intervals:
  - [-1, 2]: -5
  - [3, 4]: 0

- **Graph B:**
  - What is the average rate of change for the following intervals:
  - [-5, -3]: 5
  - [-3, 1]: -5

After students complete the table, have them look at the coordinates of the zeros and those of the vertex in their tables. Then use the questions below to have a class discussion. Have students refer to the information on the table to help them answer.
Understanding the symmetry of quadratic functions and their graphs (Look at row 5 in the chart and the tables).

   a. What patterns do you see in the tables of values you made next to Graph A and Graph B?

   In both tables, the x-values increase by one and the y-values either increase, and then decrease or vice versa. The y-values move toward the vertex value (either increasing or decreasing), and then begin to retrace earlier y-values symmetrically after passing the vertex and moving away from its y-value again.

Finding the vertex and axis of symmetry (Look at rows 1 and 2 of the chart).

   b. How can we know the x-coordinate of the vertex by looking at the x-coordinates of the zeroes (or any pair of symmetric points)?

   The x value of the vertex is halfway between any two symmetric points (the average of the x-coordinates). (Developing this concept is crucial for graphing quadratic functions. Build fluency in finding the equation of the axis of symmetry by having students give the equation of the axis of symmetry for several graphs as they work through this lesson.)

Understanding end behavior (Look at rows 3 and 4 of the chart).

   c. What happens to the y-values of the functions as the x-values increase to very large numbers? What about as the x-values decrease to very small numbers (in the negative direction)?

   At both ends, the y-values increase toward +∞ for Graph A (opens up) and toward −∞ for Graph B (opens down).

Here are the equations for Graphs A and B:

Graph A, \( f(x) = (x - 2)^2 - 1 \)  
Graph B, \( f(x) = -(x + 2)^2 + 4 \)

d. How can we know whether a graph of a quadratic function will open up or down?

   When looking at the function’s graph, you can physically see it. When looking at the function’s equation, for those that open down the leading coefficient is any negative number. (Note: these two functions have 1 and −1 for leading coefficients. If students do not see this connection right away have them graph, or you project the graphs of, several equations in their graphing calculator to see the connection.)

Identifying intervals on which the function is increasing (or decreasing) (Look at row 6 in the chart).

   e. Is it possible to determine the exact intervals that a quadratic function is increasing or decreasing just by looking at a graph of the function?

   We can only be certain if enough points of the graph are labeled for us to determine the vertex with certainty.

Computing average rate of change on an interval (Look at row 7 in the chart).

   f. Explain why the average rate of change over the interval [1, 3] for Graph A was zero.

   The function values at the two endpoints of the interval were the same.

g. How are finding the slope of a line and finding the average rate of change on an interval of a quadratic function similar? How are they different?

   They can both be found using the formula \( \frac{f(a) - f(b)}{a - b} \). However, the average rate of change is the SAME for every interval of a linear function and is typically DIFFERENT for most intervals of a quadratic function.
Lesson 08 Exploring the Symmetry in Graphs of Quadratic Functions

Extension Question:

- One has to look very hard to find two intervals on the graph of a quadratic function with the same average rate of range. Can you find some?
  - For Graph A an example is $[1, 3]$ and $[0, 4]$ both have an average rate of change of 0. For Graph B, an example is $[-2, 1]$ and $[-1, 0]$ both have an average rate of change of $-3$.

![Graph A](image_1.png)

![Graph B](image_2.png)

Exploratory Challenge 1:

Before you see only one side of the graph of a quadratic function, complete the graph by plotting these additional points of the quadratic function. Explain how you found these points then fill the table on the right.

<table>
<thead>
<tr>
<th>$x$</th>
<th>$f(x)$</th>
</tr>
</thead>
<tbody>
<tr>
<td>$-3$</td>
<td>$-6$</td>
</tr>
<tr>
<td>$-2$</td>
<td>$-1$</td>
</tr>
<tr>
<td>$-1$</td>
<td>$2$</td>
</tr>
<tr>
<td>$0$</td>
<td>$3$</td>
</tr>
<tr>
<td>$1$</td>
<td>$2$</td>
</tr>
<tr>
<td>$2$</td>
<td>$-1$</td>
</tr>
</tbody>
</table>

- a. What are the coordinates of the x-intercept?
  - $(-4, 0)$ and $(3.7, 0)$ (though estimations, but should be close to $\pm \sqrt{3}$)

- b. What are the coordinates of the y-intercept?
  - $(0, 2)$ (point out that this is also the vertex)

- c. What are the coordinates of the vertex? Is it a minimum or a maximum?
  - $(0, 2)$ is a maximum.

- d. If we knew the equation for this curve, what would the sign of the leading coefficient be?
  - It would be negative since the graph opens down.

- e. Verify that the average rate of change for interval $[-3, -1]$ is $-2$, $[-3, -2]$ is 5. Show your steps.
  - Using the formula for average rate of change $\frac{f(b) - f(a)}{b - a}$
    - $\frac{(-1 - (-6))}{-1 - (-3)} = \frac{5}{2}$

- f. Based on your answer for row 6 in the table for Exploratory Challenge 2, what interval would have an average rate of change of $-5$?
  - If the graph is increasing at an average rate of $\frac{5}{2}$, then it should decrease at a rate of $-5$. 

...
Lesson 08 Exploring the Symmetry in Graphs of Quadratic Functions

Closing (2 minutes)
- The graphs of quadratic functions have a unique symmetrical nature with a maximum or minimum function value corresponding to the vertex.
- When the leading coefficient of the quadratic expression representing the function is negative the graph opens down and when positive it opens up.

Lesson Summary
Quadratic functions create a symmetrical curve with its highest (maximum) or lowest (minimum) point corresponding to its vertex and an axis of symmetry passing through it when graphed. The $x$-coordinate of the vertex is the average of the $x$-coordinates of the zeros or any two symmetric points on the graph.

When the leading coefficient is a negative number, the graph opens down and its end behavior is that both ends move towards negative infinity. If the leading coefficient is positive, the graph opens up and both ends move towards positive infinity.

Problem Set Sample Solutions

1. Khaya stated that every $y$-value of the graph of a quadratic function has two different $x$-values. Do you agree or disagree with Khaya? Explain your answer.

   *The graph of a quadratic function has two different $x$-values for each $y$-value except at the vertex, where there is only one.*

2. Is it possible for the graphs of two different quadratic functions to each have $x = -3$ as its line of symmetry and both have a maximum at $y = 5$? Explain and support your answer with a sketch of the graphs.

   *Students should sketch two graphs with vertex at $(-3, 5)$ and different $x$-intercepts.*
Lesson 08 Exploring the Symmetry in Graphs of Quadratic Functions

1. Consider the following key features discussed in this lesson for the four graphs of quadratic functions below:
   - Vertex, x-intercept, line of symmetry, vertex, and end behavior.

   ![Graphs A, B, C, D](image)

   a. Which key features of a quadratic function do graphs A and B have in common? Which features are not shared?
      - Some – line of symmetry.
      - Different – vertex, different sign of leading coefficient, y-intercept, x-intercepts, and end behavior.

   b. Compare the graphs A and C and explain the differences and similarities between their key features.
      - Some – line of symmetry, vertex, x-intercepts, y-intercept, and end behavior.
      - Different – same, Graphs A and C are the same. The shapes of the graphs are cropped similarly so it may appear that the two are different.

   c. Compare the graphs A and D and explain the differences and similarities between their key features.
      - Some – line of symmetry and vertex
      - Different – x-intercepts (point out that graph B does not have a y-intercept, x-intercept, and end behavior.

   d. What do all four of the graphs have in common?
      - All four graphs have the same line of symmetry.

4. Use the symmetric properties of quadratic functions to sketch the graph of the function below, given these points and given that the vertex of the graph is the point (0, 5).

   ![Graph with points (0, 5), (1, 3), (2, -3)]

   Solution:

   ![Solution graph with points (0, 5), (1, 3), (2, -3)]
